

## Structured: Your Technology Partner

# Storage Assessment and Services

With mounting daily storage concerns and exponential data growth, the ability to accurately assess storage capacity and functionality has become increasingly critical. Additionally, storage administrators face added pressures related to higher service level requirements, longer retention periods and increased capacity needs.

Structured can help.

Through Structured's storage assessment professional services we develop a comprehensive understanding of the performance, resiliency, and capacity of your entire storage infrastructure.

Structured Storage Assessment overview:

**Current Environment**—We determine the current size and expected growth of your environment. Then we find out how your application environment will grow. We also establish whether you store mostly structured data (e.g.databases) or unstructured data (e.g., files, images, video). Finally, we assess the impact of data loss on your customers, employees and suppliers.

**Backup Operations**—Structured carefully examines your processes, such as how well your IT disaster recovery plan is defined and implemented, and how well your backup and recovery processes are defined and implemented. Additionally, we assess the extent to which your personnel can execute these processes effectively. It's also important to find out the extent to which backups affect your production systems.

**Recovery Performance**—We evaluate your defined service level expectations for backup frequency and recovery performance. Structured helps you determine your recovery point objectives, recovery time objectives and the impact of data loss on your business. Additionally, we examine your email system and mailbox recovery capabilities.

Following our analysis, we deliver you an assessment document that details our findings and the solutions that we recommend for maintaining your information integrity. Our consultants will then present the findings to your company's key members to illustrate how properly designed and managed storage aligns the business value of data with the cost of storing it.

## PROFESSIONAL SERVICES

- Assessment & Remediation
- Capacity Planning
- Configuration & Deployment
- Design & Implementation
- Disaster Recovery Planning
- Performance Monitoring & Testing
- Policy Development
- Cloud & SAAS Solutions
- Managed IT Services
